"Socio-Political Science" Department Researcher

Abstract:	Keywords
This article analyzes thoughts on the formation of a scientific worldview and global thinking in young people, personal worldview in young people, issues of stimulating creativity, intelligence and effective thinking. Some recommendations are given on the formation of a scientific worldview and global thinking in young people.	IELTS, creativity, "20 Ideas Method", "I am a Genius Method", intelligence and thinking, knowledge and experience.

Introduction

The ability of young people to learn is unlimited. Einstein once said that every child is born a genius. The child comes to the world with the ability to learn and perceive in such a way that it is worth it only to envy. In infancy in the first two years of life, 20-30 sounds acquire the attachment of simple letters to words only. During this period, the child develops his mind surprisingly. If children from 2 to 5 years old seem to be tested for creativity, 90-95% of them show surprising results. As the child domesticates, creativity begins to decline, why? They grow up, go to school. If we retest the above group of children after they are 7-8 years old, then 10% of them show creativity much higher than the average. For whatever reason you say so, they have already learned to connect dots with stripes, paint the cow brown instead of blue. Now they began to meditate on the textbook method. Children learned not to make noise incessantly, to be obedient, not to be halal to others. They learn not to touch what they are interested in as a result of which their actions are limited. If the child wants to talk or get out of class, he will have to raise his arms. Such factors cause the child to lose his creative approach to the older davti.

How to stimulate creativity, intelligence? One widely used method is speech development. The more vocabulary a person has, the more productive he thinks, the more creative he becomes in the rain. "We have at our disposal an extensive Dictionary of more than 100,000 words. However, we use an average of 1200 words. How insignificant numbers![1]. A person with Minimal information uses about 400 different words a day. It is in words that the thoughts, worldview, imagination, ideas, spiritual world, culture, concepts of people, especially young people, are expressed. The more vocabulary a person has, the more creative he thinks. When we pay attention to young people who are learning English, at first they memorize more words. Reading profusely increases vocabulary through the use of dictionaries. Such an action will pay off.

=====

Some recommendations for the formation of a scientific worldview and global thinking in young people:

1.As soon as the opportunity arises, repeat "I am a genius" this word is located in the subconscious, the human brain is flooded with new ideas. Behave like a person who thinks creatively on all fronts. Try developing and putting useful ideas into practice. Whatever sport is for our body, such an approach to the human mind is also of great importance.

2.A game where you can play with yourself. In situations that arise in your life, "how would I react in this situation as a genius? What would I do? ask a question. As a genius, look for solutions to situations.

3.Do not forget that concentration is the key to Awakening Your complete creative potential.

4. Use the "20 ideas method". Does it work in sugar? All successful people used writing when they nodded on any question. So do you. Write down the problem or goal that worries you in the form of an interrogation. For example: what should I do to lose weight by 8 clograms over the next six months if you want to lose weight to your sidekick? Or how long should I purposefully prepare for the IELTS (International English Language Testing System) 8 Apple per day for the coming year? write that big-big. In this case, you need to write down 2o answers to the question that is tormenting you. Not 19, but at least 20, much better if you can write 25 or even more answers through different approaches. In this, a creative spirit, creativity develop and solutions appear.

5.It is much more important to set a specific deadline for yourself. If the implementation of the Goal takes a long time, make an annual, semi-annual and monthly plan in this.

6.An important feature of a successful person is self-confidence. Do you believe in yourself? To what extent do you consider yourself responsible for your life? Know that it is impossible to imagine a person who controls others, but is deprived of a sense of responsibility for himself. The sense of responsibility makes non-existence a rascality.

7.If he wants to grant the creator a gift, he will certainly put some kind of problem in front of him. The greater the difficulty you face, the greater the gift will await you.

8.Never forget that your success depends on the ability to analyze, make decisions and act on the problem.

A person can never live without an idea, without purpose, without thought, without reason and thinking. Obdon contemplates and plans the work he intends to do before embarking on doing any fists. Any idea first matures in a person's mind, and then brings it to life. These ideas are carried out by people who have acquired and realized a certain system of experience, needs and necessities, set themselves the goal of completing certain tasks. "Whatever is done by the human mind, by the hand, on its ground lies spirituality, which is formed as a skill of thought, knowledge, idea, ability, talent, experience, work[2]. A human child cannot achieve any success, new discoveries without reason and thinking, knowledge and experience.

=====

In the creative processes that move Life forward, as well as in the connections that motivate or hinder development, the individual manifests himself as a subject (active beginning).

When a human child does not get used to carrying out each work responsibly independently from an early age, he later gets into the habit of avoiding independent responsibility by his willlessness or will.

Experience shows that if a person is not used to making decisions and taking responsibility from childhood, then later he will try to avoid decisions at his discretion and the responsibility that accompanies him. As a result of such upbringing, the labor force is formed, studying for a long time at school, knows a lot, at the same time it becomes less capable and does not understand what is happening in society. Part of this workforce will be referred to as "professionals" in the future.

Society is led to progress not by performers, but by creative people who fully perceive reality and can behave as subjects and want to serve as national elites in the interests of society.

A person matures not only through education, but also through the means of unity of upbringing and experience.

"The collapse cannot be stopped if the people are frivolous, loquacious, UN-flowing, allow themselves to be deceived, lack the courage and intelligence to keep Gaddi upright " [3].

It can be safely said that one should not expect salvation from idleness and laziness.

The main issue of the environment of perfection is the understanding that everyone needs to take care of themselves and thus create the necessary conditions for the success of those around biga. In the environment of perfection, it is necessary to create conditions for an individual to have the courage to think and speak independently, to have the ability to analyze, make decisions and generalize. It educates the possibility. The most memorable is what a person realizes, what causes inner light.

If a waterfall of seedlings is planted on the existing area and weeds are growing, there will be no point in expanding the field area. Knowledge-must be connected and systematic with nature, society and culture. Creating and maintaining order is a specific type of knowledge, an important component of upbringing.

People can read and research a significant part of their knowledge.

In the process of reasoning and reasoning, understanding is formed.

Thus, on a more equitable basis, we must develop the human potential. It is our spiritual and social duty, but behind it are also hidden huge opportunities.

To some extent, we need to eliminate the sources of social and economic inequality that depend on how we approach the development and use of human abilities. Each economic period has its own main asset. In agricultural times it was an active land, in the Industrial Age-capital, and in our time-it is knowledge, skills and human qualities.

People who live learning from life, who are not indifferent, become wise. As jalaliddin Rumi said " Don't wait for the Beautiful days to come. Do not forget to go towards him."

Today, under the leadership of our President Shavkat Miromonovich Mirziyoyev, he opens

=====

the door to a wide range of opportunities for talented, educated youth of Uzbekistan, who are taking steps towards a new life. The development of the motherland, the development of the state, of course, is a huge reality. But nothing will change as long as the selfless children of the nation, the worldview of the people, do not form a new thinking. The nation, the state, can only be matured and elevated by strong educated, ambitious, selfless young people.
